WARNING

AIRCREW EJECTION SEATS ARE FITTED TO THIS AIRCRAFT

Before attempting to enter the cabin ensure that the instructions detailed on the LETHAL WARNING marker card at the front of the handbook have been complied with. This is very important.

ENGINE

The air intake safety guards should be fitted at all times when engine is being ground run except when it is intended to take off after running up. It is essential that personnel are aware of the air intake depression and jet efflux danger areas as shown in Sect.2, Chap.2.

RESTRICTED

Introduction

1. This chapter contains information on the general servicing of the complete aircraft, together with tables listing the Standard and Special Ground Equipment and the Special Tools required for the operations described. This special equipment has been designed to eliminate any possibility of damage and distortion occurring during servicing and should, therefore, be used in preference to other

types of similar equipment, as otherwise the efficiency of the aircraft may be seriously impaired. When carrying out servicing operations, ensure that the air-intake and jet-pipe blanking boards are in position. Other covers or protective devices should also be fitted, provided that they do not impede the progress of the work in hand. Servicing, dismantling and lubricating information applicable to particular assemblies and installations is

covered in the appropriate chapters of Sections 3, 4, 5, 6 and 7. The servicing procedure for the standard components installed in this aircraft will be found in the relevant Air Publications listed at the beginning of this volume, or mentioned in the text.

Standard and special ground equipment

2. The ground equipment provided for use when servicing this aircraft is listed in Table 1 below:-

TABLE 1
Standard and special ground equipment

Subject	Ref.No.	Part No.	Description	No.off	Application
TOWING AND STEERING	4GB/3071	—	Arm forward steering	1	Steering from spools on nose wheel
	26FX/95612	D.218657	Adapter, towing arm	1	
	4GB/4174	—	Towing arm long Mk.2	1	Used with D.218657
JACKING EQUIPMENT	4GB/4138	—	Bridle, towing	1	Backward towing from main undercarriage
	4Q/2617	—	Jack, lifting, 5-ton	3	
	4Q/2620	—	Trestle Mk.3	2	Main jacking under wing, used with 4Q/2617
	4Q/2618	—	Trestle Mk.1	1	Main jacking under nose, used with 4Q/2617
	4Q/2655	—	Jack adapter head, Mk.102	3	For use with 4Q/2617
	4Q/2667	—	Jack, pillar, hydraulic 8-ton	1	Wheel changing, nose and main
	4Q/2807	—	Jack adapter head, Mk.113	1	For use with 4Q/2667
	26FX/95606	B.205909	Pads, jacking, wing	2	
	26FX/95607	B.208925	Pads, jacking nose	1	
	26FX/95608	A.205912	Bracket jacking nose undercarriage	1	Nose wheel changing
26FX/95609	B.205914	Bracket jacking main undercarriage	1	Main wheel changing	
TRESTLING EQUIPMENT	—	—	U.J. Trestle No.1	2	Component trestling
	—	—	U.J. Trestle No.6	4	Component trestling, wing
	26FX/95041	C.190878	Cradle, trestle, forward rear fuselage	1	
	26FX/	C.232866	Cradle, trestle, aft rear fuselage	1

Note . . .

Special tools for gun servicing on Mk.8 aircraft are listed in Sect.7, Chap.3.

TABLE 3
Packing Dimensions (fig.1)

Component	Height	Width	Length	Weight (lb)
Nose piece	2 ft 5 in.	2 ft 8 in.	2 ft 4½ in.	20
Front fuselage	6 ft 0 in.	5 ft 1¼ in.	15 ft 5¼ in.	900
Centre fuselage	5 ft 10 in.	10 ft 0 in.	16 ft 0 in.	1425
Rear fuselage	6 ft 9½ in.	4 ft 2½ in.	17 ft 1 in.	600
Tail cone	3 ft 6½ in.	3 ft 2 in.	4 ft 1 in.	75
Wing	2 ft 1 in.	11 ft 4 in.	19 ft 8 in.	972
Rudder	5 ft 2 in.	0 ft 8 in.	2 ft 0 in.	35
Fin	6 ft 0 in.	0 ft 7½ in.	4 ft 10 in.	60
Tail plane	0 ft 6½ in.	7 ft 11 in.	11 ft 10 in.	206
Elevator	0 ft 9 in.	1 ft 11 in.	7 ft 8 in.	67½
Aileron	0 ft 5 in.	2 ft 7 in.	8 ft 8 in.	75
Flap	0 ft 5 in.	2 ft 7 in.	7 ft 6 in.	70
Wing tip	0 ft 7 in.	0 ft 11 in.	5 ft 2¼ in.	6
Hood	2 ft 4 in.	4 ft 4 in.	4 ft 10 in.	150
Ammunition box	2 ft 7 in.	9½ in.	2 ft 0 in.	40
Bullet fairing	0 ft 10½ in.	0 ft 9 in.	3 ft 5½ in.	5

Dimensions given are to the nearest quarter of an inch. The weight of a component is for a single item only.

Order of dismantling and assembly

4. The breakdown points for dismantling the aircraft are shown in fig.1. The recommended order of dismantling is as follows:-

- (1) Jack up the aircraft (fig.2) and retract the alighting gear.
- (2) Position the component trestles to fully support the aircraft.
- (3) Remove the outer wings (Sect.3, Chap.2) after removing any external stores which may be fitted.

Note . . .

The flaps, ailerons and pylons, if fitted, may be removed after the wings have been dismantled from the fuselage.

- (4) Remove the rear fuselage (Sect.3, Chap.1).

Note . . .

The rudder, elevators and tail plane (Sect.3, Chap.3) may be removed before or after the rear fuselage is removed from the centre fuselage

- (5) Remove the engine (Sect.4, Chap.1).

- (6) Remove the front fuselage (Sect.3, Chap.1).

- (7) Remove the fuselage nose portion if necessary (Sect.3, Chap.1).

5. The assembly of the principal components is, in general, a direct reversal of the procedure given in para.4.

41	Electrical connections	83	Wheel brake	127	General access
42	Electrical connections	84	Main undercarriage door	128	General access
		85	Fuel transfer pipe & pressure relief valve		
		86	General access		

Jacking, trestling and slinging

6. The methods to be employed and the jacks, trestles, etc., to be used when jacking, slinging and trestling the complete aircraft for servicing are illustrated in fig.2. It should be noted that the fuselage jacking pad has a concave bearing surface and must not be interchanged with the wing jacking pad, which has a flat bearing surface.

Note . . .

It is advisable to check the charging of the main undercarriage legs before lowering the aircraft off the trestles (A.P.1803E, Vol.1, Sect.2).

Access doors and panels

7. The positions of the access doors and removable panels are shown in fig.3, the components to which they give access being given in the key. When handling the doors and panels, care should be taken to ensure that they are not damaged or distorted in any way. When re-fitting them, ensure that they fit flush with the surrounding surface and that they are secure and effectively locked. Screws removed from access panels must be replaced by screws of the same length, after first ensuring that fouling has not already taken place, otherwise damage to components, pipe lines or structure in the vicinity of the panel may occur.

◀ Note . . .

The screws and bolts required for the attachment of the dorsal fin panels are detailed in fig.6. ▶

Fig.4 Toggle Fasteners

Toggle fasteners

8. Certain removable panels are secured in position by toggle fasteners (fig.4). To open these fasteners, the catch lever (1) marked PUSH is depressed with the fore-finger (*do not use tools*) causing the hook integral with this lever to disengage from pin (2) in the toggle lever (3), withdrawing it from the housing and disengaging the fastener. For re-engagement, the hooks on the end of the toggle lever are engaged in the recess and the lever pressed home with the palm of the hand. Adjustment is accomplished by screwing up or unscrewing the links (4), after first slackening off the grub screw (5) in the side face of the links. One turn of the thread on the links gives 0.036 in. of adjustment and the total adjustment available is 0.5 in. When adjustment is satisfactory, the grub screw must be re-tightened.

Note . . .

The grub screw must be slackened off before adjustment as otherwise the threads will be damaged. The grub screw must be re-tightened after adjustment.

9. Certain access doors in the under-surface of the fuselage are secured by Arctic type toggle fasteners fig.4. To open these fasteners, the knurled safety catch plate (1) is depressed and the lever (2) ejected sufficiently to enable it to be easily withdrawn from the housing

(3) For re-engagement, the lever is engaged with the housing and then pressed home with the palm of the hand. Adjustment is accomplished by removing the split pin and then screwing up or unscrewing the links. One turn of the thread on the links gives 0,036 in. and the total adjustment available is 0.5 in. When adjustment is satisfactory, lock with a split pin.

Rigging of fixed surfaces

10. When checking the alignment of the structure by means of the diagonal dimensions given in fig.5, there is no need to trestle the aircraft. When the incidence and dihedral are being checked, the aircraft must be trestled in the flying position, with the equipment shown in fig.2. The procedure for rigging is as follows:—

- (1) Check the alignment of the structure.
- (2) Jack up the aircraft and level it transversely, by means of a straight edge and spirit level placed across the fuselage side members against the windscreen arch.
- (3) Place a levelling spigot (*Ref.26FX/95143*) into each of the levelling points attached to the fuselage structure in the port wheel bay and level the aircraft longitudinally with a straight edge and spirit level placed across these two spigots. The trestle at frame 55 is to be adjusted to take the

weight of the rear fuselage after the aircraft has been levelled longitudinally.

- (4) Check the incidence and dihedral of the wings, using the gauges quoted in Table 1.
- (5) Check the incidence and dihedral of the tail plane, using the gauges quoted in Table 1.
- (6) When checking the variable incidence of the tailplane use a clinometer with the clinometer base Pt.No.D.231154 (*fig.5*). To fit the base, remove the port top tailplane fairing, locate the lugs between the front and rear tailplane spars, with the side of the base painted red facing outboard and secure to the appropriate anchor nuts normally used for the tailplane fairing.

The adjustment of the individual control surfaces is described in Sect.3, Chap.4.

Miscellaneous drain points

11. A series of small holes, extending from frame 19 (*Sect.3, Chap.1*) to the tail end, are provided in the undersurface of the fuselage to allow any moisture and surplus fuel which may accumulate between these frames to drain away. Surplus fuel from the high pressure cock, combustion chambers and the exhaust unit is conducted through pipes to eject at the bottom of the fuselage. All the drain holes should be inspected periodically to ensure that they are

not blocked, otherwise an accumulation of fuel, with its resultant fire may arise. Small cocks are provided at the lowest points of the fuel system, together with a drain plug in the engine fuel filter casing, to enable any water or sediment to be drained from the fuel (*Sect.2, Chap.2*). Moisture drain traps are also provided in the pitot installation (*Sect.5, Chap.2*).

Cleaning cabin hood

12. When cleaning or polishing the cabin hood, care must be taken to ensure that no rags that have been in contact with trichlorethylene are used, as rags so contaminated will cause serious damage to the surface. Refer to A.P.1464D, Vol.1, Part 2, Sect.5, Chap.5, for detailed instructions on the care of transparent plastic panels.

Cleaning cabin

13. When wiping over those portions of the instrument panels, shelves, etc., which contain labels, only clean dry rags should be used. Many of these labels will be damaged if rags impregnated with fuel, grease solvent or thinners are used.

Pipe lines

14. Before the assembly of pipe lines of the fuel system, hydraulic system and air conditioning system (*not the oxygen system*), the threads of all pipe couplings should be lubricated with anti-seize compound ZX-28G. When re-assembling pipe lines, ensure that the arrows on the pipes, non-return valves and other components, point in the direction of flow. Tighten the unions by hand first and examine the lay of the pipe to ensure that the maximum clearance from other pipes, components or structure is obtained to eliminate the possibility of chafing. After final tightening, ensure that the clearance has been maintained.

RESTRICTED

LEVELLING AIRCRAFT

FOR TRANSVERSE LEVELLING, USE A STRAIGHT-EDGE ACROSS THE COCKPIT HOOD RAILS AND AGAINST THE WINDSCREEN FRAME. SEE BELOW

FOR LONGITUDINAL LEVELLING SPIGOTS ARE PROVIDED ON THE FUSELAGE SKIN IN THE PORT WHEEL BAY 4 IN. BELOW THE FUSELAGE DATUM

RESTRICTED

RESTRICTED

◀ **Hot air ductings**

15. Every opportunity must be taken to examine hot air ductings throughout the life of the aircraft, particular attention being given to the following :—

- (1) Damage to, or discolouration of, ducts, pipes, wiring or structure adjacent to hot air ductings, which may be indicative of gas leakages.
- (2) Security and condition of all duct joints.
- (3) Duct lagging for sign of damage.
- (4) Visible portions of duct metalwork, particularly in the vicinity of welds for signs of cracking. ▶
