**Equipment employed**

1. The major components employed in the cabin lighting circuit are listed below, together with the appropriate Air Publications to which reference should be made for detailed descriptions and information on the servicing required to maintain them in an efficient condition.

Dimmer switches, Type R.22 and 75 ohms  
Emergency lights and emergency compass  
light switches, single pole, change-over  
◀ centre off (Ref.5CW/11752)

Cabin lamps, Type C, No.2

Ultra-violet lamps, Type B, No.1.

**DESCRIPTION****Cabin lighting****General**

2. The cabin lighting installation consists of five separately controlled circuits supplying lamps to illuminate the instrument panels, cabin shelves and the standby compass. The following paragraphs describe

A.P.4343C, Vol.1, Book 1, Sect.1. ►

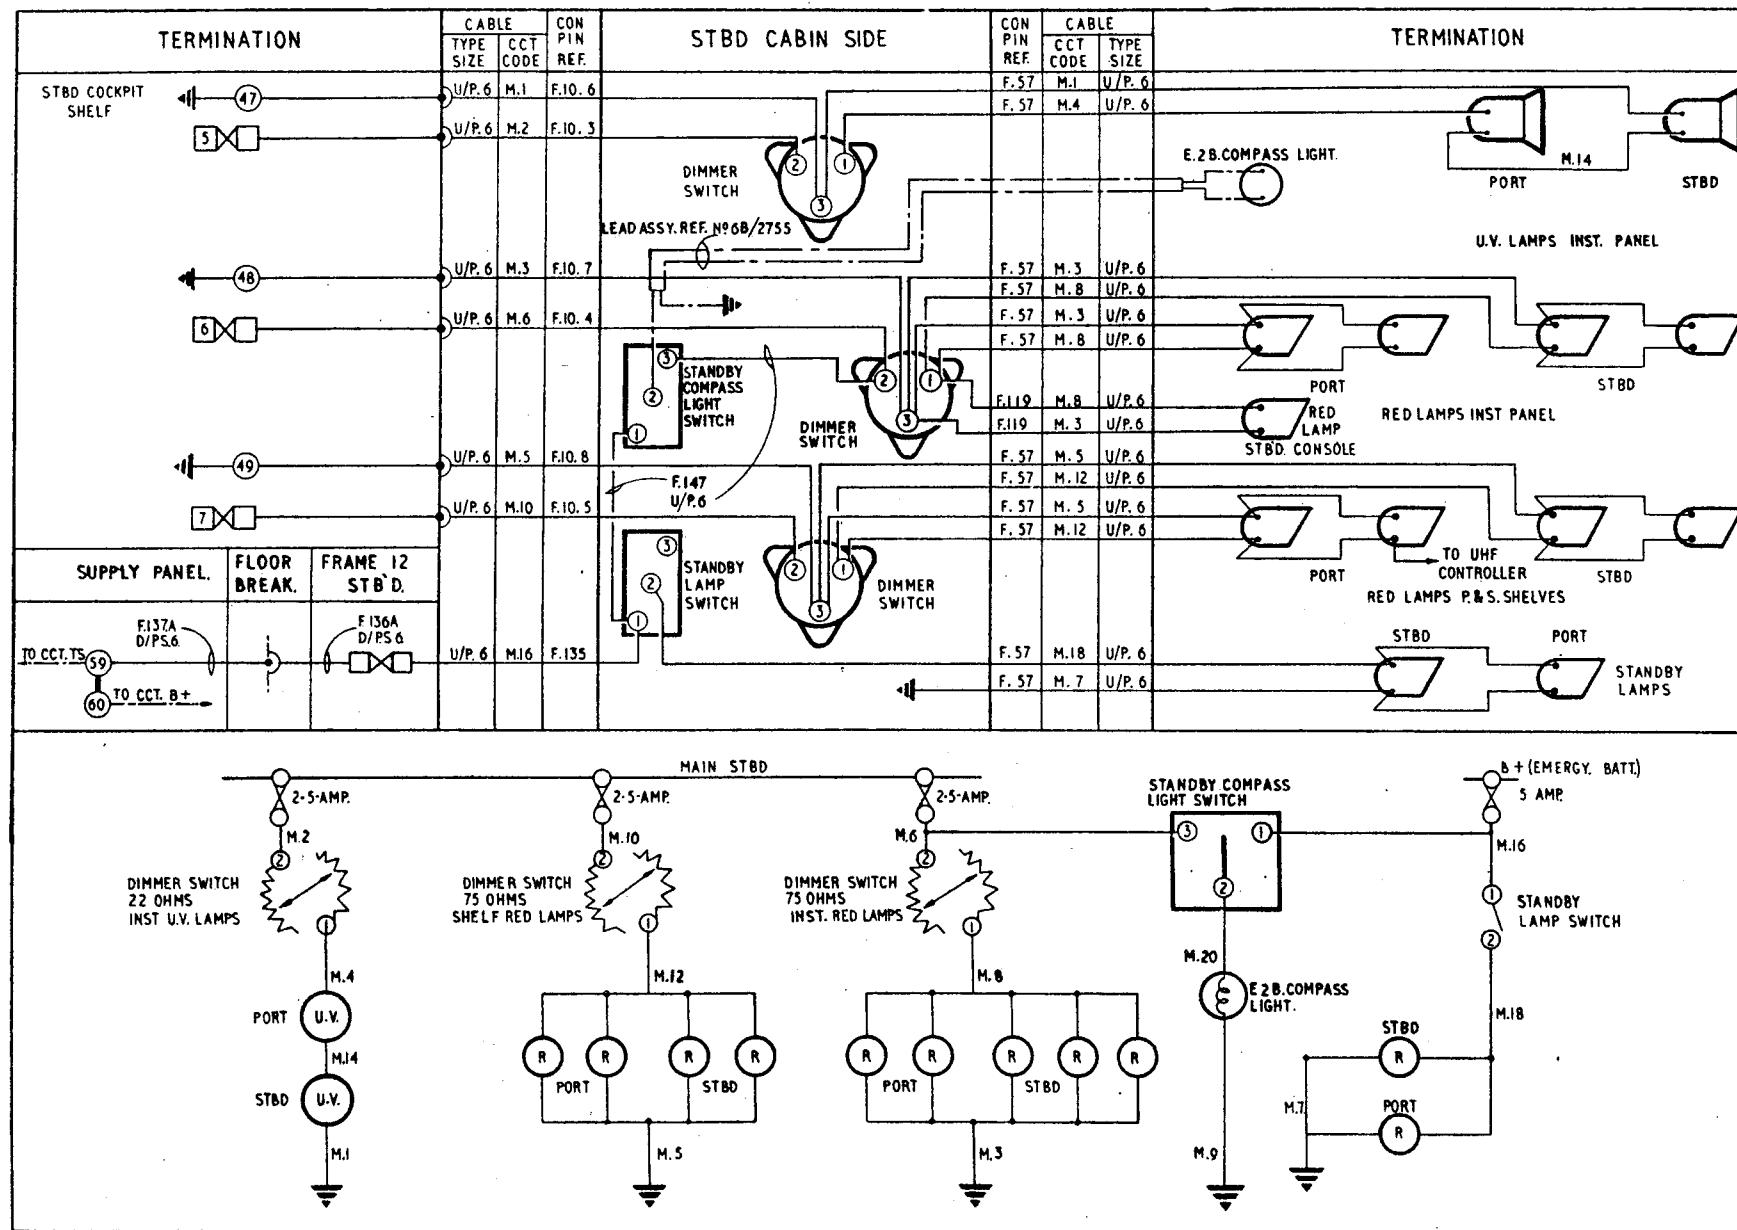

each of these circuits in turn. Routing and theoretical diagrams of the circuits are given in fig.1,

**Ultra-violet lamps**

3. Two ultra-violet lamps, connected in series and controlled by a dimmer switch are positioned one on each side of the cabin, just forward of frame 10 and below the light deflector screens, so that their beams fall on the fluorescent instruments on the instrument panels. The dimmer switch is mounted at the top of a bracket attached to the fuselage skin above the cabin starboard shelf, just forward of frame 10.

**Instrument panel red lamps**

4. Five red lamps illuminate the instrument panels; they are connected in paral

RESTRICTED

and positioned two on each side of the cabin, just forward of the ultra-violet lamps, and one on the starboard forward face of frame 10. These lamps are switched on and dimmed, as required, by a dimmer switch mounted below the ultra-violet lamps switch on the starboard side of the cabin.

*Cabin shelf red lamps*

5. Another four red lamps, also connected in parallel, are located two on each side of the cabin on frames 10 and 11, to illuminate the cabin shelves. These lamps are switched on and dimmed, as required, by a dimmer switch mounted below the instrument panel red lamps switch.

*Standby lamps*

6. Should the normal cabin lighting fail, two red standby lamps may be brought into operation. These lamps are mounted one on each side of the cabin below the light deflector screens, adjacent to the instrument panel red lamps. The lamps are not connected to the normal electrical system,

but obtain their supply from the standby batteries mounted in a battery box in the radio bay (Group B.1). A single pole ON/OFF switch, located on frame 9 above the cabin starboard shelf and labelled CABIN STANDBY LIGHTS, controls the installation. This switch is provided with a luminous dolly to make it readily distinguishable in darkness.

*Standby compass lamp*

7. The Type E.2.B standby compass introduced by Mod.660, incorporates a lamp with a miniature non-magnetic filament. The control switch for this light is a centre-off change-over switch marked NORMAL-OFF-STANDBY, with a luminous dolly. The switch is mounted on the same bracket as the cabin standby lights switch (Para.6). When the switch is in the NORMAL position the lamp is supplied from the main supply line of the aircraft's electrical system, but when in the STANDBY position, the lamp is supplied from the standby batteries (Group B.1 of this chapter). The compass can thus be illuminated should the aircraft's normal electrical system fail.

*Operation*

8. The operation of the circuits should be obvious once reference is made to the theoretical diagrams, given in fig.1 of this group.

**SERVICING**

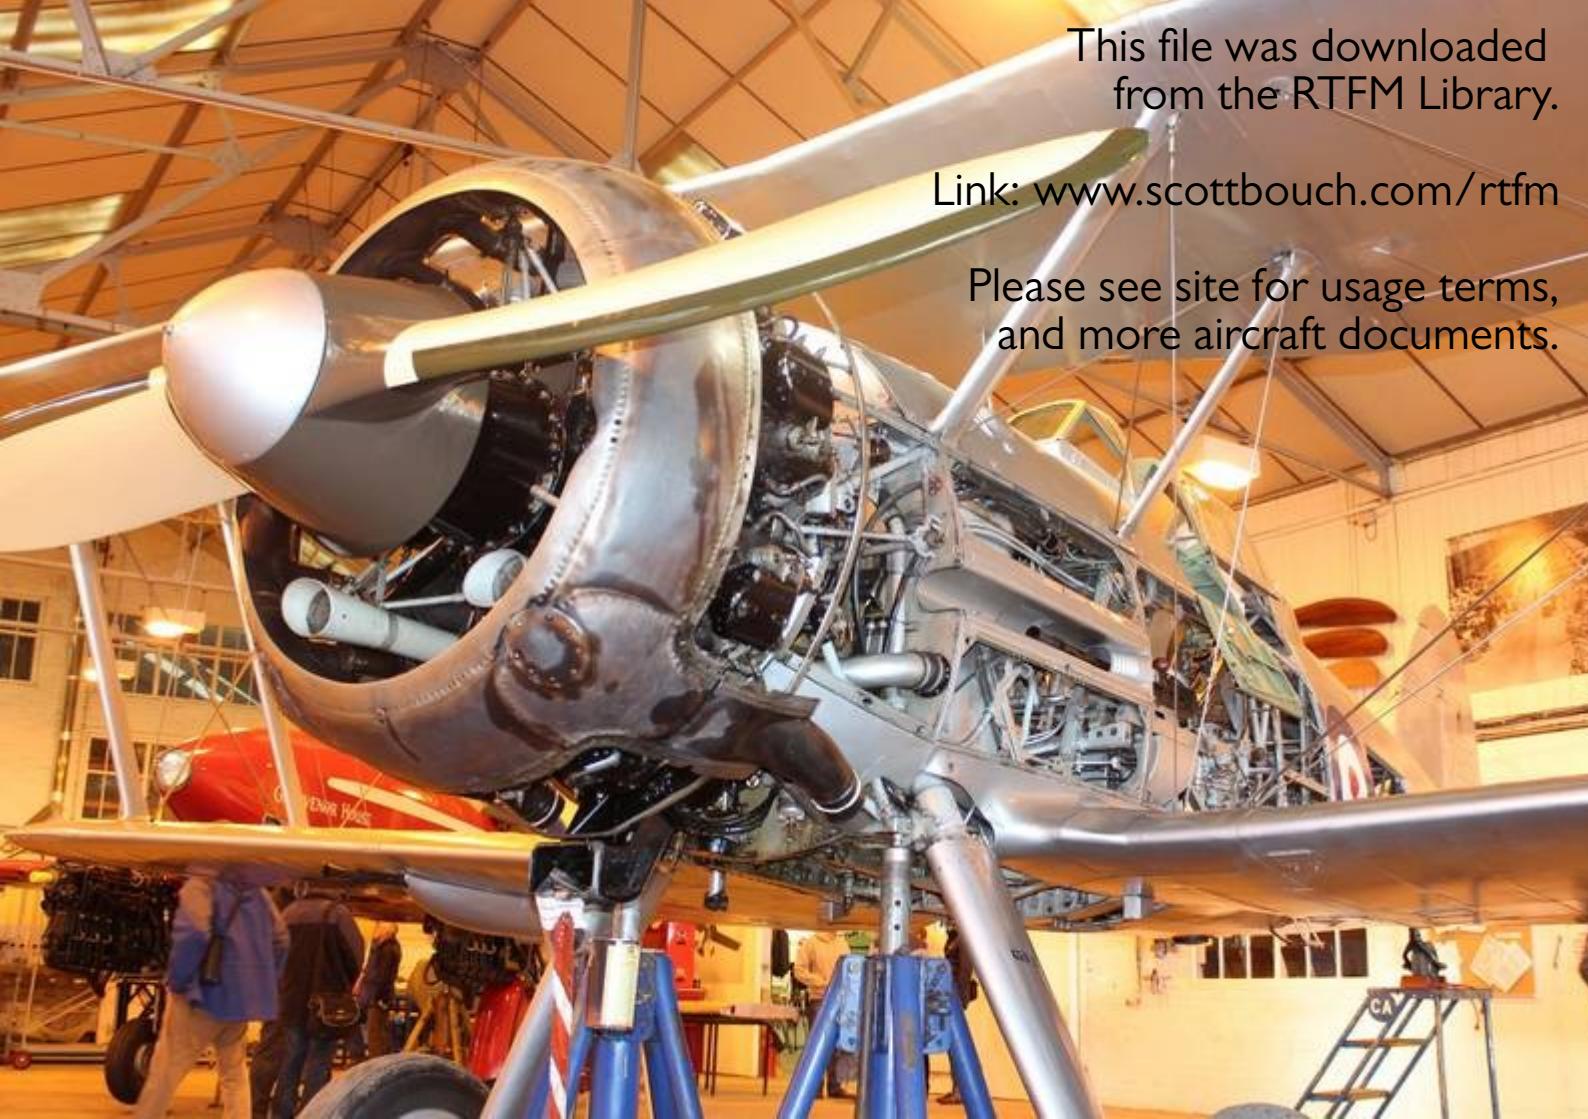

*General*

9. For general servicing of the electrical system, reference should be made to Group A.1 of this chapter, which also contains a table giving the types of filament lamps used in this circuit. Apart from keeping all the components clean and checking the filament lamps for serviceability, no further servicing should be necessary.

**REMOVAL AND ASSEMBLY**

*General*

10. The removal and assembly of the components forming the cabin lighting circuit should present no unusual difficulties. The location and access to all the components is indicated in Group A.3.

A large propeller aircraft, likely a Douglas C-47 Skytrain, is displayed in a museum hangar. The aircraft is positioned on a blue hydraulic lift, with its front landing gear extended. The engine and propeller are visible on the left side. The interior of the aircraft is partially open, showing the cockpit and the engine compartment. The aircraft is surrounded by museum exhibits, including a red and white airplane in the background and various informational displays. The hangar has a high ceiling with exposed structural beams and lighting fixtures.
