Introduction

1. The data contained in this chapter is to enable the centre of gravity (C.G.) of an aircraft to be computed for any distribution of load. This enables investigation to be made into changes in the C.G. which may result from the expenditure of fuel, bombs, etc., and/or movement of crew, immediately after

take-off or at any stage of the flight.

2. The basic weight and C.G. quoted in the following examples are average figures only and, when computing a loading the true basic weight and C.G. relative to the aircraft under consideration must be substituted. Reference should be made to the "Basic weight and moment

record" form which will show the true basic weight and moment of the particular aircraft concerned.

3. The C.G. can also be determined practically by weighing the aircraft; reference should be made to A.P.1464D. Vol.1, Sect.1, Chapter 3 and Sect.2, Chap.3A of this Book.

RESTRICTED

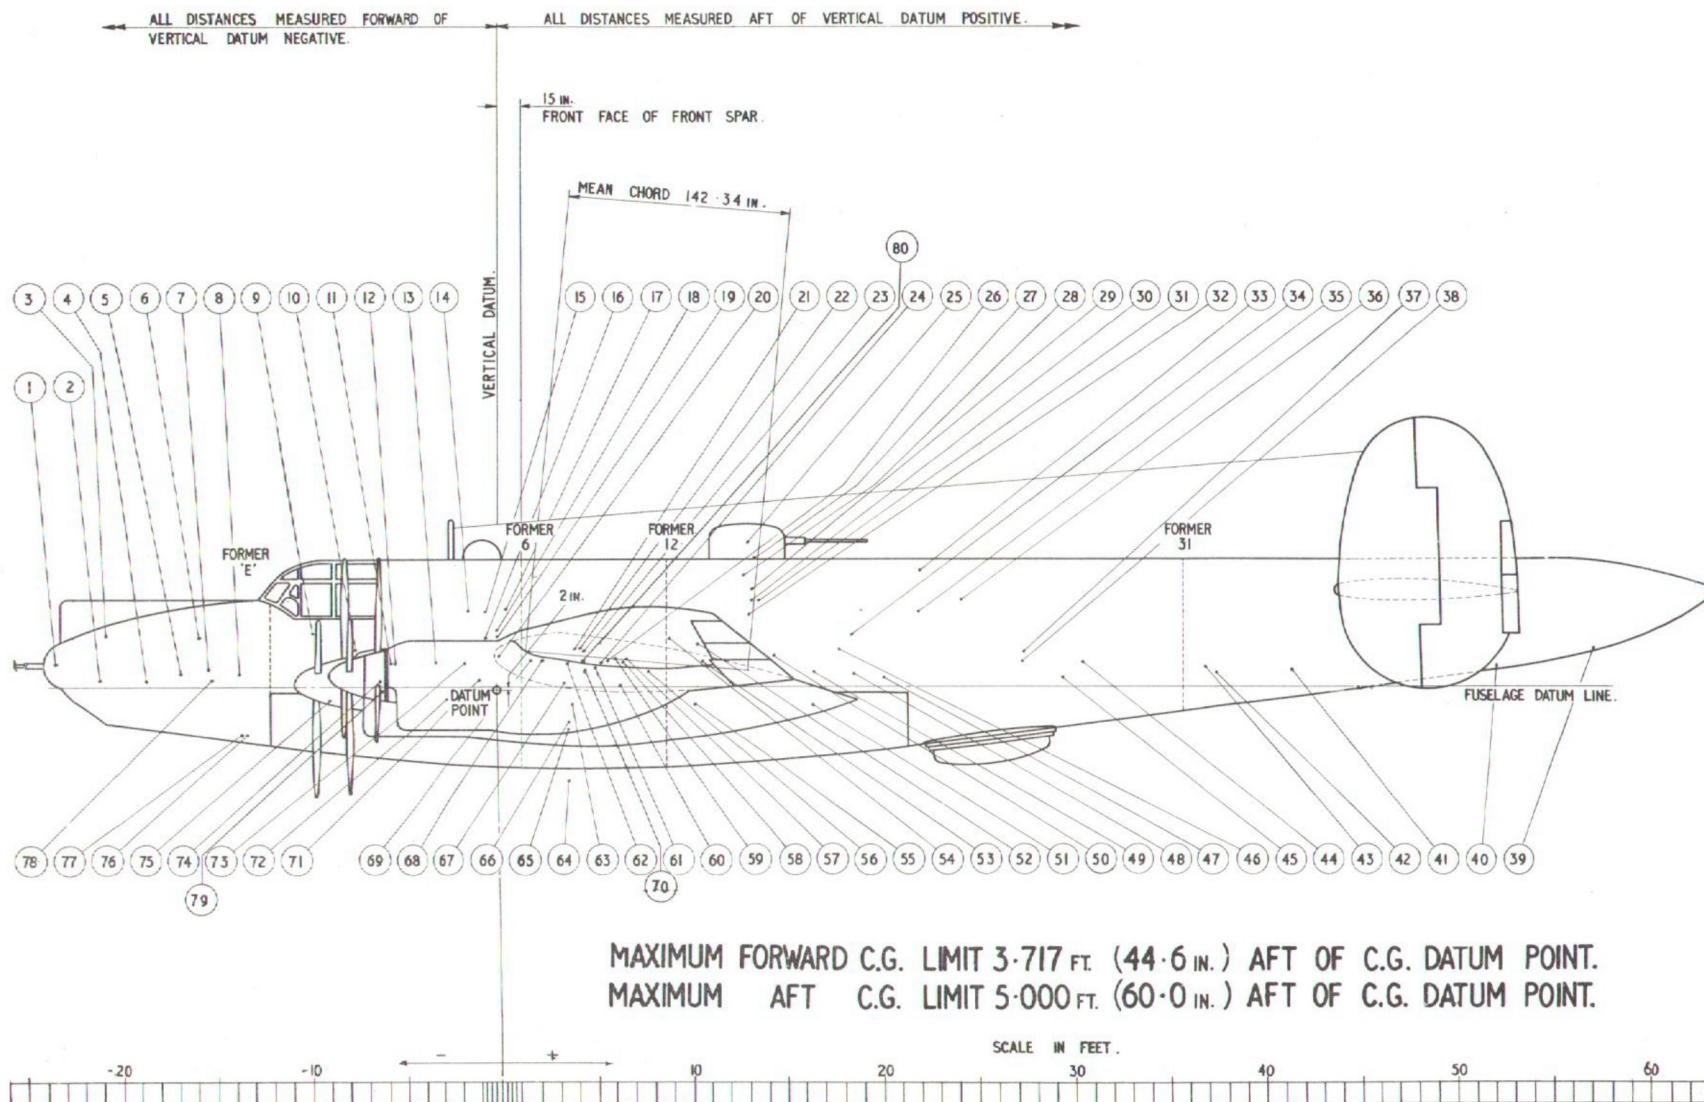

Fig. I. Loading & C.G. diagram

RESTRICTED

DEFINITION OF THE C.G.

4. The C.G. is defined by its distance in feet, measured parallel to the fuselage datum line, from a reference point known as the C.G. datum point (para.5). This distance is called the moment arm (para.6) of the C.G. and is determined from the following expression:-

$$\frac{\text{Basic weight} \times \text{Weight of loads}}{\text{basic moment arm}} + \frac{\text{Weight of loads} \times \text{respective arms}}{\text{Basic weight} + \text{Total weight of loads}}$$

$$= \frac{\text{Basic moment} + \text{load moment}}{\text{Total weight}}$$

DATUM POINT

5. The datum point is arbitrarily located by the manufacturer, and on Shackleton aircraft is indicated on both port and starboard sides of the fuselage by a removable plug which is situated 1.25 ft. forward of the front face of the front spar and 2 inches below the fuselage datum line. The locations are provided for the suspension of a plumb line when determining the C.G. by weighing.

MOMENT AND MOMENT ARMS

6. The moment of an item is the product of its weight (lb.) and its moment arm (ft.), measured parallel to the fuselage datum line from the datum point. The moment arm of a load lying forward of the datum point is negative, although the load is positive. Therefore the resultant moment is negative. The moment arm of a load lying aft of the datum point is positive therefore the resultant moment is positive.

C.G. RANGE

7. The approved C.G. limits are as follows:- Maximum forward C.G. limit/44.6 in. (3.717 ft.) aft of datum point; maximum aft C.G. limit 60 in. (5.0 ft.) aft of C.G. datum point; and the C.G. must be

kept within this range at all times, including take-off and landing.

C.G. MOVEMENT DURING FLIGHT

8. A loading which gives a satisfactory C.G. for take-off, may be so affected by expenditure of fuel, etc., that the C.G. passes beyond its limit. The possibility of this occurrence must always be considered. The effect of retracting the undercarriage has been taken into consideration in establishing the safe C.G. range and may, therefore, be neglected.

DEFINITION OF BASIC WEIGHT

9. Basic weight is that weight which includes all basic equipment and unusable fuel and oil, to which it is only necessary to add the weight of variable, expendable and payload items in the various roles to arrive at the all-up weight. Complementary items of removable equipment will be found in the list of operating equipment and these must be added in conformity with the required loading of the aircraft (see para.14).

MOVEMENT OF CREW

10. Careful note must be made of the direction of movement, and also location of the crew stations which may be either forward or aft of the aircraft datum point, e.g., consider moving the starboard observer to the galley position, both these moments are positive and, as the moment at the galley position is less than the moment at the starboard observer's position, the smaller moment must be subtracted from the greater, which will result in the aircraft C.G. moving forward.

lb. ft.

Moment at starboard observer's position	5,480
Moment at galley position	2,100
Difference		3,380

Similarly the opposite effect is incurred if we consider moving the air bomber to the rest bunk. The air bomber is forward of the aircraft datum point and has a negative moment. The rest bunk is aft of the aircraft datum point and has a positive moment; and, as the air bomber is moving aft, he passes the datum point and so the moment at the air bomber's position must be added to the moment at the rest bunk and the sum of these moments added to the aircraft moment in order to find the resultant C.G. of the aircraft.

lb. ft.

Moment at air bomber's position	-3,700
Moment at rest bunk position	3,710
Total	7,410

TYPICAL EXAMPLE

11. The following calculation shows the method of computing the all up weight of the aircraft from the "Delivery" basic weight and moment, by use of the Basic Weight and Moment Record Sheet.

This is based on the Anti-submarine case, Role C.

1. *Basic weight and moment record sheet*
This sheet is provided with each aircraft and is a continuous history of changes in structure or equipment affecting the weight and moment. It gives the current basic weight and moment of the aircraft to be used as the start of any loading calculation.

The initial entry shows the basic weight and moment obtained from the C.G. report of the particular aircraft and then proceeds to tabulate all equipment which falls into the category of service fit items and also any shortages that there may be.

This reduces the aircraft to the delivery condition, i.e., the basic weight and

moment of the aircraft as delivered to the service and is termed "Delivery Basic Weight."

The "Basic Moment" quoted on these sheets is the commencement for all loadings when the C.G. Computor is used.

The following sheets act as a typical example of corrections to the Basic Weight and moment Record Sheet.

Water/methanol (26 gall.)	59	234	1,493	-
Total maximum fuel	-	23,937	130,218	-

NOTE... Fuel weight taken at 7·2 lb./gall.

Water/methanol weight taken at 9 lb./gall.

(5) Calculation of Gross Weights:-

	(lb.)	(lb. ft.)
Gross weight excluding fuel	64,212	Corresponding moment 292,209
Maximum weight of fuel	23,937	Corresponding moment 130,218
Gross weight	88,149	Corresponding moment 422,427
C.G. of aircraft	=	Gross moment Gross weight
	=	422,427
	=	88,149
	=	4·795 ft. (57·54 inches) aft of the datum point.

(6) Calculation of C.G. for landing (100 gall. fuel reserve)

Nomenclature	Item No.	Weight (lb.)	Moment (lb.ft.)	
			Positive	Negative
Fuel No.1 tanks (994 gall.)	61	7,157	35,907	-
Fuel No.2 tanks (1,082 gall.)	24	7,790	40,765	-
Fuel No.3 tanks (494 gall.)	26	3,557	20,303	-
Fuel No.4 tanks (622 gall.)	60	4,479	27,640	-
Expendable items (para. 2)	-	8,320	35,016	-
Water/methanol (26 gall.)	59	234	1,493	-
Total expendable load	-	31,537	161,124	-

Movement of crew to Landing Stations

	Moment (lb.ft.)	
	Positive	Negative
Move stbd. observer to station aft of front spar	-	4,794
Move port observer to station aft of front spar	-	5,434
Move tactical navigator to station forward of rear spar.	1,325	-
Move radar operator to station forward of rear spar	-	25
	1,325	10,253
∴ Moment effect	=	8,928

Weight and C.G. for Landing

Landing weight = 88,149 - 31,537 = 56,612 lb.

Corresponding moment = 422,427 - 161,124 = 261,303 lb.ft.

$$\text{Landing C.G. position} = \frac{261,303}{56,612}$$

= 4·616 ft. (55·39 inches) aft of the datum point.

				Positive	Negative
Crew member at crash station forward of rear spar	58	180	6.625	1,193	-
Crew member at crash station aft of front spar	67	180	3.429	617	-
Freight carrier and bomb bay container	-	130	-	-	-

NOTE...

When calculating C.G. movement in flight, the total weight of ammunition is not expended (see alternative items). It must be borne in mind that the expendable part of the total weight is subtracted from the weight of the aircraft. For the mid-upper turret ammunition, having a positive arm, the resultant moment is negative and must be subtracted from the aircraft moment. For the forward gun ammunition, having a negative moment arm, the resultant moment is positive and must be added to the aircraft moment.

MAXIMUM WEIGHTS

15. The maximum take-off and landing weights are as follows:-

Maximum all-up weight = 89,000 lb.

Provided that the following restrictions are observed:-

(1) Normal accelerations not to exceed 2g. and manoeuvres, during the early stages of flight, are limited to gentle turns. Turbulent airconditions to be avoided.

(2) Manoeuvres appropriate to the long range reconnaissance role may be performed after the weight has been reduced to 82,000 lb.

(3) Fuel to be consumed from the inboard tanks first.

Landing weight = 72,000lb.

OVERLOAD LANDING WEIGHT

16. The aircraft are now cleared to land at weights not exceeding 77,000 lb. when dictated by operational necessity and provided that extra care is taken when landing at weights above 72,000 lb. At these higher weights the reserve factors on the main alighting gear and engine mountings become marginal; the new limitations should, therefore, be regarded as an "Overload" case.

C.G. COMPUTER

17. A C.G. computer (Ref.No.26FP/5284) has been designed for this aircraft. The instructions for use are appended herewith:-

- (1) Set cursor hairline to basic moment (* see note below).
- (2) Move slide until zero of selected item is under hairline.
- (3) Move cursor in direction indicated by arrow until hairline is over quantity being loaded.
- (4) Starting from last setting of cursor, repeat operations 2 and 3 for each item or compartment.

NOTE...

The basic moment = $\frac{\text{Basic weight} \times \text{arm(in feet)} \text{ about a/c datum}}{10,000}$

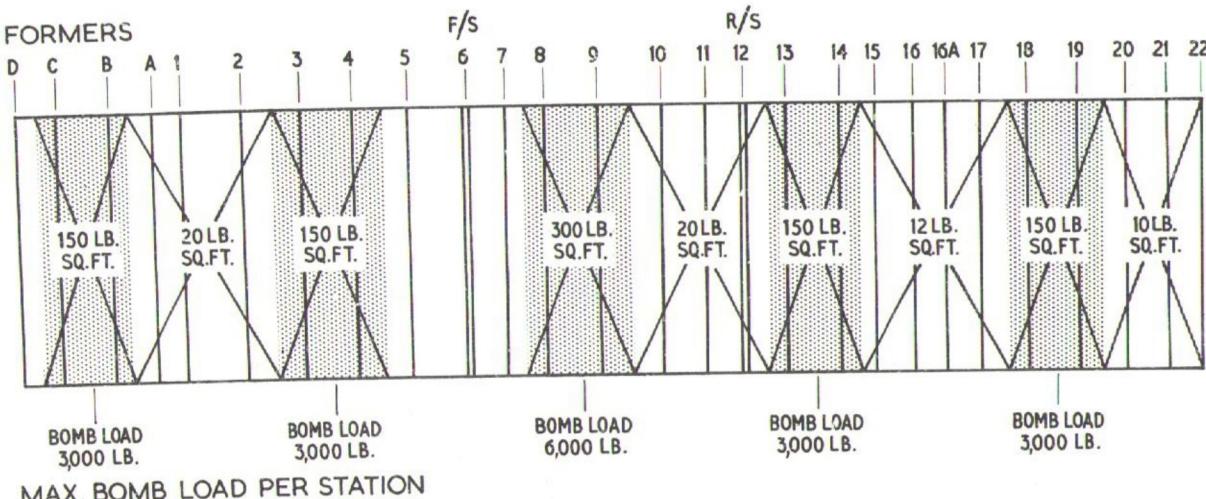

Fig.3. Floor loading data

RESTRICTED

- (5) The final position of the cursor hairline must be within the fore-and-aft limits as shown on scale on the inside face of the rule.
- (6) The actual C.G. position (in feet aft of the aircraft datum) may be obtained by removing slide and reading C.G. position under hairline against the appropriate weight line on scale.
- (7) To obtain the C.G. position for landing, the instructions for items 2 and 3 will have to be reversed, i.e., from the C.G. position obtained in item 6, move slide until the quantity of the load to be expended is under hairline, move cursor hairline over zero, repeating the operation for all expendable items. The final landing C.G. position being obtained as in item 6.

FLOOR LOADING DATA (fig. 3)

18. Data on additional floor loading when carrying spares and ground equipment for special flights is given in the illustration.

19. On the shaded areas, which are areas over bomb supporting formers, the loading shown represents floor loading with no bomb load. When full bomb load is carried, the additional floor load is nil with linear variation when only a portion of the full bomb load is carried. The total floor loading should not exceed the full bomb load, i.e., 15,000 lb. (refer to Case 'D', para.20), distributed to suit C.G. conditions. All loadings assume that the load is distributed over at least

two floor beams.

20. The placing of loading planks longitudinally across and over the low dimensional floor areas from one bomb supporting former to another will enable heavier loads to be transported, attention always being paid, however, to bomb loading in the same area and C.G. requirements.

UNUSABLE FUEL

21. After defuelling, the aircraft must be rigged with the aircraft horizontal datum level, and the tanks drained in accordance with the instructions contained in Sect.4, Chap.2 of this Book. The

◀ weight and moment of the fuel to bring to Basic Weight are:-

Weight of fuel 57 lb.
Moment +305 lb.ft. ▶

MODIFICATIONS

22. When an aircraft is weighed by the manufacturer its Basic Weight and Index are quoted together with the modifications that are embodied at the time of weighing. Before a particular aircraft Basic Weight is used, it should be ascertained if further modifications have been added, if so the Basic Weight and Index should be raised on the Record Card, R.A.F. Form No.4908.

RESTRICTED

Addendum I**INCORPORATION OF PHASE 1**

Fig. 1 (overleaf) shows the location of items of removable military load when Phase 1 has been incorporated in the aircraft. The facing key details the new equipment and gives weights, arms and moments. Items shown on the illustration but not quoted in the Key (a typical service load) are the same as those detailed in the various tables in the preceding Chapter 3.

The C.G. is 4·885 ft. (58·62 in.) aft of the aircraft datum

In this case, all the stores carried in the bomb bay with the exception of the Dealer 'B', are fitted on special carriers attached to the appropriate slips. The centres of gravity of these stores do not coincide with slip positions, (reference should be made to Sect.7, Book 2 of this publication) and are as follows:-

Row 1	Sonobuoys	-9·565 ft.
Row 2	Sonobuoys	-4·267 ft.
Row 2	Marine markers	-4·267 ft.
Row 3	Depth charges (forward end of carrier)	1·317 ft.
Row 3	Dealer 'B'	3·838 ft.
Row 3	Depth charges (aft end of carrier)	6·588 ft.
Row 4	Sonobuoys	11·685 ft.
Row 5	Marine markers	16·195 ft.
Row 5	Sonobuoys	16·195 ft.

REMOVABLE EQUIPMENT

The basic weight of the aircraft includes the following items of removable equipment.

Nomenclature	Item No.	Weight (lb.)	Arm (ft.)	Moment (lb.ft.)	
				Positive	Negative
Aircraft destructor	32	6	13·5	81	-
Signal pistol and cartridges	13	11	- 5·5	-	61
Electrical equipment	71	15	0·266	4	-
Flying and navigational inst.	70	64	0·17	11	-
Camera F.60 (allowance)	46	10	29·5	295	-
Camera F.24	39	42	57·25	2,405	-
Camera FX.91	40	42	52·25	2,195	-
